This data handbook was generated on July 7, 2025 based on the metadata of the German National Cohort. The current version of the data handbook is available under transfer.nako.de/transfer/media/data-handbook. The next data handbook will be available in one to two months.

# Preamble

The German National Cohort is the largest long-term population study currently being conducted in Germany. Over a period of more than 20 or 30 years, it intends to collect medical data for epidemiological research into common diseases - their causes, prevention, early diagnosis and treatment - and provide it to scientists. NAKO began recruiting people with a main residence in Germany who were randomly drawn from the population registries at the start of 2014. By September 2019, more than 205,000 people aged between 19 and 75 had been received at the 18 NAKO study centers for the first examination and included in the cohort as participants after signing the consent form. In the study centers, surveys (interview and self-completed) and examinations were carried out over a period of approximately three to six hours. Furthermore, biosamples were taken and stored long term. Further information about NAKO, e. g. the target diseases, can be found at nako.de/en and especially the study design and program in [1], [2], and [3].

The first written follow-up survey (GEFU-1) was successfully conducted from 2017 to 2023 with over 171k participants. The second survey was successfully conducted in the period from October 2018 to August 2024 with over 138k participants in the study centers. In addition, two special COVID-19 surveys were successfully conducted with up to 161k participants during the pandemic. The data collected directly from participants was supplemented by secondary and registry data as well as mortality data. Non-personal data, e. g. environmental data or statistical socio-economic data, were assigned to the participants via their place of residence. In an MRI sub-study, whole-body MRIs lasting one hour were performed on almost 31k (first assessment) and over 19k (second assessment) participants. In addition to the data derived from these medical data, this is essentially the dataset that scientists can now obtain from NAKO free of charge on request. A fee may be charged for the finite aliquots of biosamples.

The terms to use and access NAKO data is codified in particular in the use and access policy, which every scientist (who wishes to work with NAKO data) must undertake to comply with. The NAKO Transfer Unit in Greifswald and Heidelberg and its website TransferHub (transfer.nako.de) is the contact point for all scientists interested in the NAKO data. The data directory in TransferHub shows which data can be requested. The desired data elements can be selected, the application with the described research question can be submitted and the compiled data can be downloaded from TransferHub after review, approval and conclusion of the contract with the scientific institution.

We define metadata as all data that describe the units and items of the NAKO data (e. g. identifiers, designations, descriptions, units of measurement, data types, scale levels, select options). This metadata is compiled together with some counts of units and items in this Data Handbook. The Data Handbook is intended solely to provide

information about the NAKO data that can be requested outside TransferHub. Data must always be requested directly in TransferHub by selecting the specific data elements and only data from completed surveys can be requested. It should also be noted that the number of participants is permanently reduced due to withdrawals of consent by participants and the removal of their data from the NAKO databases (small two-digit number per year).

# Chapter 1

# Overview of the examinations of the collections

This chapter aims to provide a quick overview of the examinations conducted in the actual collections and applicable for scientific evaluation.

## 1.1 Listing and counting of the examinations (units) in the Baseline examination

The following table lists all examinations (incl. interviews et cetera) and their derivations Baseline examination of the baseline study (incl. MRI study). The column "collected" counts the participants, for which the examination was successfully carried out and fully documented. The column "applicable" counts the participants whose data is applicable for scientific evaluations within the framework of usage applications.

| Examination (unit) | collected | applicable |
|---|---|---|
| Basic data: Age, gender, extent of examinations | 204,710 | 204,690 |
| Derived variables allergies | 204,363 | 204,373 |
| Medical Anamnesis - Allergies (U1) | 204,391 | 204,409 |
| Derived variables eye diseases | 204,305 | 204,315 |
| Medical Anamnesis - Eye diseases (U1) | 204,333 | 204,350 |
| Derived variables women's questions | 102,994 | 103,001 |
| Women (U1) | 103,010 | 102,996 |

## 1.3 Listing and counting of the examinations (units) in the Second re-examination

The following table lists all examinations (incl. interviews et cetera) and their derivations Second re-examination of the baseline study (incl. MRI study). The column "collected" counts the participants, for which the examination was successfully carried out and fully documented. The column "applicable" counts the participants whose data is applicable for scientific evaluations within the framework of usage applications.
The collection Second re-examination started in June 2024.

### 2.1.2.2 Migration

Aus den vorliegenden Befragungsdaten wurde zunächst eine Einteilung in 8 Kategorien (+ missing) vorgenommen:
MIG=0: Nationalität Deutsch, Geburtsland D, Eltern in D geboren oder unbekannt/keine Angabe (kein Migrationshintergrund), Gefahr der Misklassifikation bei unbekanntem Elternteil.
MIG=1: Als Deutsche im Ausland geboren und beide Elternteile in Deutschland geboren (kein Migrationshintergrund).
MIG=3: Nachkommen von Vertriebenen: Personen mit deutscher Staatsbürgerschaft, in Deutschland geboren, ein Elternteil in Polen, Russland oder Tschechien geboren (kein Migrationshintergrund), Gefahr der Missklassifikation.
MIG=4: Vertriebene: Personen mit deutscher Staatsbürgerschaft, in Polen, Russland oder Tschechien geboren und vor 1953 eingereist. Eltern in Deutschland geboren oder unbekannt, weiß nicht, keine Angabe (kein Migrationshintergrund).
MIG=5: Ausländer (Migrationshintergrund).
MIG=6: Nachkommen von Personen mit Migrationshintergrund: Personen mit deutscher Staatsbürgerschaft, in Deutschland geboren, Eltern nicht in Deutschland, Polen, Russland oder Tschechien geboren (Migrationshintergrund).
MIG=7: Eingebürgerte: Personen mit deutscher Staatsbürgerschaft, im Ausland geboren, mindestens 1 Elternteil im Ausland geboren, keine Aussiedler (Migrationshintergrund).
MIG=8: Aussiedler: Deutsche Nationalität, in einem ausgewählten Land der früheren SU (Russland, Ukraine, Kasachstan, Weissrussland) geboren, Eltern ebenfalls in einem dieser Länder, ggf. einem Nachbarland geboren (Migrationshintergrund).
MIG=Missing: Informationen unzureichend für die Bestimmung eines Migrationsstatus.
Auf Basis dieser Kategorien wurden die abgeleiteten Variablen zur Migration ermittelt.

## 2.2 Correction weights

| | |
|---|---|
| **Type** | Project |
| **Superordinate** | baseline data, p. 11 (Program) |
| **Title** | Correction weights |
| **Name** | Correction weights |
| **Description** | Correction weights for taking into account the influence of sampling designs and non-response |
| **Subordinate** | Correction weights, p. 34 |

### 2.2.1 Correction weights

| | |
|---|---|
| **Type** | Examination (unit) |
| **Superordinate** | Correction weights, p. 33 (Project) |
| **Name** | Correction weights |
| **Title** | Correction weights (survey weights) |
| **Description** | Design weights (wgt_design_) and total weights (wgt_total_; product of design weight and calibration weight) are provided for the NAKO data set. As a rule, the total weights (wgt_total_) should be used. The design weights (wgt_design_) should only be used in justified cases with appropriate expertise. While design weights only take into account the sampling procedure or the selection probability of survey units, the total weights also include the non-response probability of survey units and the distribution of certain characteristics within the population. The weighting was not based on the population distribution of Germany as a whole, but on the population distribution in the study regions actually covered by the NAKO study centres. The weights are provided in two standardisations (_18sc, _16sc): Normalisation to 18 study centres (_18sc) and a normalisation combining the three Berlin study centres (_16sc). The respective allocation to the study centres is coded in the variables wgt_geoSC_18sc and wgt_geoSC_16sc. Separate correction weights are provided for each survey wave (baseline, second study, third study), which can only be used for the data of the respective wave. The design weighting was based on the number and composition of the population (gender, age group) according to the official population update of the Federal Statistical Office (year: 2014-2019, regional level: municipality). The calibration weighting was carried out using a raking procedure (Iterative Proportional Fitting) based on microcensus data (year: 2019, regional level: district) for the characteristics: - age group (' 60'), - gender (female vs. male), - nationality (German vs. non-German), - migration status (yes vs. no), - education (ISCED low vs. middle vs. high), - household size (1 vs. 2 vs. 3 or more persons). Methodology: Sand, Matthias and Kunz, Tanja (2020). Weighting in practice. Mannheim, GESIS - Leibniz Institute for the Social Sciences (GESIS Survey Guidelines). DOI: 10.15465/gesis-sg_030 |

#### 2.2.1.2 Quality Assurance

Variables for quality assurance and determination of weights for subsequent waves

##### 2.2.1.2.1 Design weight normalised (18 study centres)

| | |
|---|---|
| **Type** | Variable |
| **Superordinate** | Correction weights, p. 34 (Examination) |
| **In subsection 1** | Quality Assurance |
| **Title** | Design weight normalised (18 study centres) |
| **Description** | Design weight, standardised at study centre level, so that the sum of the weights corresponds to the number of participants at the respective study centre (at the time of weighting). Assignment of cases to study centre see variable wgt_geoSC_18sc. |
| **Data type** | DOUBLE |

#### 3.3.1.1.2 Contraceptives and hormone replacement products

Birth control pills, hormonal contraceptives, topical contraceptives, hormone replacement products. Based on the data available, it is assumed that the majority of women are not aware of the difference between the contraceptive pill and the mini-pill. The duration of use of the contraceptive pill is therefore NOT included in the calculation of the total duration of use of contraceptives. Similarly, information indicating parallel use of the contraceptive pill and the mini-pill is not considered implausible, unlike the parallel use of other hormonal contraceptives. First-time use of hormone replacement products at an age 70 years was assessed as implausible.

### 3.4.1.2 Psoriasis

Die Lebenszeitprävalenzen der Psoriasis scheinen zu hoch, obwohl die Angaben in allen Filter- und Folgefragen (z.B. 12-Monatsprävalenz, Häufigkeit Psoriasisarthritis, Flächenbefall der Psoriasis) plausibel sind. Bei weiterführenden Analysen empfiehlt es sich daher Psoriasisfälle nur über die 12-Monats-Prävalenzen zu definieren.

### 3.4.3.2 Status of the examination module Med. an. - Skin diseases (U2/ U3)

| | |
|---|---|
| **Type** | Variable |
| **Superordinate** | Med. His. - Skin diseases (U2/ U3), p. 117 (Examination) |
| **Title** | Status of the examination module Med. an. - Skin diseases (U2/ U3) |
| **Description** | Indicates whether the examination module Med. an. - Skin diseases (U2/U3) was completed correctly or why not |
| **Data type** | SMALLINT |
| **Scale niveau** | hierarchical |
| **Approval** | Raw data not quality-assured |
| **Option list** | untersuchungsstatus (Examination status acc. to t_dd_examination_status); see p. 5926 |

## 3.5 Cardiovascular/metabolic diseases

| | |
|---|---|
| **Type** | Project |
| **Superordinate** | interview, p. 39 (Program) |
| **Title** | Cardiovascular/metabolic diseases |
| **Name** | Cardiovascular/metabolic diseases |
| **Description** | - |
| **Subordinate** | Derived variables HKE, SWE and HK-relevant OP, p. 120, Medical Anamnesis - Cardiovascular diseases (U1), p. 140, Medical Anamnesis - Metabolic disorders (U1), p. 147, Med. His. - Metabolic diseases (U2/ U3), p. 159, Med. His. - Cardiovascular diseases I (U2/ U3), p. 175, Med. His. - Cardiovascular diseases II (U2/ U3), p. 183 |

### 3.5.1 Derived variables HKE, SWE and HK-relevant OP

| | |
|---|---|
| **Type** | Examination (unit) |
| **Superordinate** | Cardiovascular/metabolic diseases, p. 120 (Project) |

| | |
|---|---|
| **Name** | Derived variables HKE, SWE and HK-relevant OP |
| **Title** | Derived variables HKE, SWE and HK-relevant OP |
| **Description** | Derived variables cardiovascular/metabolic diseases/cardiovascular-relevant operations, adjusted according to QA reports NAKO-104 (DF100k) and NAKO-435 (baseline, calibration). |
| **Unique identifier** | abg_man_hke_swe_op |

#### 3.9.3.1 Medication details

Datenqualitätssicherung Baseline (NAKO-499): Es können noch doppelt erfasste Medikamente im Datensatz enthalten sein. Darreichungsform, Preis- und Herstellerinformation wurden noch nicht qualitätsgesichert. Dosierungsangaben müssen vor Verwendung noch einmal geprüft und ggf. überarbeitet werden, da die Eingaben u.U. fehlerhaft sind. Dies betrifft insbesondere Depotpräparate, Augen-, Nasen- und Ohrentropfen sowie Insulinpräparate und Präparate mit wechselnder Dosierung. Systematische Zentrumsunterschiede bei der Erfassung können darüber hinaus zu regionalen Unterschieden insbesondere bei Vitaminpräparaten führen.

### 3.10.1.1 Age at initial diagnosis

The data is based on self-reported data. Data less than 30 years old should be considered potentially erroneous and excluded from analyses if necessary. The data is obviously subject to a strong memory BIAS. Age-dependent analyses should therefore never be carried out with the exact age data for each year, but only with suitable age groups (at least 5 years, better 10 years for knee osteoarthritis).

### 3.15.1.2 Employment status and occupation

Angaben zum Erwerbsstatus enstprechend des “Labour-Force-Konzepts“ der International Labour Organisation (ILO). Erwerbspersonen sind Personen, die aktiv am Erwerbsleben teilnehmen oder teilnehmen wollen. Dies sind folglich zum einen Erwerbstätige wie Arbeitnehmer, Selbstständige, mithelfende Familienangehörige und auch Menschen in einer beruflichen Ausbildung. Erwerbstätige sind ebenfalls Menschen in geringen oder unregelmäßigen Beschäftigungsformen (Minijobs, 450-Euro-Jobs, Ein-Euro-Jobs). Zu den Erwerbstätigen zählen auch Personen, die ungeachtet der tatsächlich geleisteten Arbeitszeit eine Bindung zu einem Arbeitgeber haben (Personen in Mutterschutz, Elternzeit und in sonstiger Beurlaubung). Zu den Erwerbspersonen zählen zweitens Erwerbslose, das heißt Personen, die nicht erwerbstätig sind, aber für die Aufnahme einer Erwerbstätigkeit zur Verfügung stehen und aktiv nach einer Arbeit suchen (Bezieher von ALG I und ALG II). Nichterwerbspersonen hingegen nehmen nicht aktiv am Erwerbsleben teil, weil sie bereits aus dem Erwerbsleben ausgeschieden sind (Rentner) oder sich noch in Ausbildung befinden (Schüler, Studenten) oder anderweitig dem Arbeitsmarkt nicht zur Verfügung stehen (Bundesfreiwilligendienst, freiwilliges soziales Jahr). Beim Umfang der Erwerbstätigkeit wird zwischen Teilzeit- ( =35 h/Woche) unterschieden. Referenzen: Statistisches Bundesamt. (2018). Statistisches Jahrbuch. Deutschland und Internationales. ## 3.15.1.2.4 Start of unemployment

| | |
|---|---|
| **Type** | Variable |
| **Superordinate** | Derived variables Sociodemographics, p. 479 (Examination) |
| **In subsection 1** | Employment status and occupation |
| **Title** | Start of unemployment |
| **Description** | Date of beginning of unemployment, 1st day of the month calculated from d_se_el1_m and a_se_el1_j. 05.01.1900 means allowed skipped (i.e. currently not unemployed), 01.01.1900 means an implausible indication. |
| **Unit or input format** | DD.MM.YYYY |

| | |
|---|---|
| **Data type** | DATE |
| **Scale niveau** | ordinal |

### 3.15.1.2.5 Current unemployment in years

| | |
|---|---|
| **Type** | Variable |
| **Superordinate** | Derived variables Sociodemographics, p. 479 (Examination) |
| **In subsection 1** | Employment status and occupation |
| **Title** | Current unemployment in years |
| **Description** | For the derivation, the date since the beginning of unemployment is subtracted from the date of the baseline survey and divided by 365.25. The total duration of unemployment can be shorter, as both variables are calculated with self-reported data. |
| **Unit or input format** | Years |
| **Data type** | DECIMAL(6,2) |
| **Scale niveau** | metric |
| **Approval** | Quality-assured data |

### 3.15.1.2.6 Total duration of unemployment in years

| | |
|---|---|
| **Type** | Variable |
| **Superordinate** | Derived variables Sociodemographics, p. 479 (Examination) |
| **In subsection 1** | Employment status and occupation |
| **Title** | Total duration of unemployment in years |
| **Description** | For the derivation, the total number of unemployed months/12 was combined with the indicated years and the current unemployment. Current unemployment can be longer, as both variables are calculated with self-reported data. |
| **Unit or input format** | Years |
| **Data type** | DECIMAL(6,2) |

### 3.15.1.2.8 Occupation code KldB

| | |
|---|---|
| **Type** | Variable |
| **Superordinate** | Derived variables Sociodemographics, p. 479 (Examination) |
| **In subsection 1** | Employment status and occupation |
| **Title** | Occupation code KldB |
| **Description** | The occupation coding is based on the classification of occupations (KldB 2010), but was further processed to classify occupations according to characteristics of interest, such as management responsibilities. This results in 1232 occupations. |
| **Data type** | MEDIUMINT(5) |
| **Scale niveau** | hierarchical |
| **Approval** | Quality-assured data |
| **Option list** | berufscode_kldb (Based on the classification of occupations (KldB 2010), but has been further processed.); see p. 5878 |

### 3.15.1.2.14 Occupational code ISCO

| | |
|---|---|
| **Type** | Variable |
| **Superordinate** | Derived variables Sociodemographics, p. 479 (Examination) |
| **In subsection 1** | Employment status and occupation |
| **Title** | Occupational code ISCO |
| **Description** | The variable stores 556 occupations according to the International Standard Classification of Occupations (ISCO-08). After manual sighting of the original designation in combination with information on the occupational status (se_b7), the nearest valid ISCO-08 code was selected. Further information on this can be found in the QA report on proposal NAKO-434 sub-section occupation. |
| **Data type** | SMALLINT(3) |

| | |
|---|---|
| **Type** | Variable |
| **Superordinate** | Derived variables Sociodemographics, p. 479 (Examination) |
| **In subsection 1** | Employment status and occupation |
| **Title** | One-digit ISCO-08 codes |
| **Description** | Corresponds to the 1-digit ISCO-08 major groups. The command iscogen from Stata was used for the creation (Jann 2019). In some cases, the coding of occupations was only possible at the 1-digit level. These cases are in the 4-digit residual category with "x000" and do not contain more information than the 1-digit codes. |

| **Title** | Three-digit ISCO-08 codes |
| **Description** | Corresponds to the 3-digit ISCO-08 minor groups. Stata's Command iscogen was used for the creation (Jann 2019). In some cases, the coding of occupations was only possible at the 1-digit level. These cases are in the 4-digit residual category with "x000" and do not contain more information than the 1-digit codes. |

### 3.15.1.2.19 Socio-economic status

| | |
|---|---|
| **Type** | Variable |
| **Superordinate** | Derived variables Sociodemographics, p. 479 (Examination) |
| **In subsection 1** | Employment status and occupation |
| **Title** | Socio-economic status |
| **Description** | ISEI is used as a measure of the socio-economic status of an occupation and is based on data on the relationship between education, occupation and income. The data basis of the ISEI-08 (International Socio-economic Index of Occupational Status) is the International Social Survey Programme (ISSP). The variable can take on values between 10 and 89. The ISEI-08 was constructed using the iscogen command from Stata (Jann 2019). |

|---|---|
| **Type** | Variable |
| **Superordinate** | Derived variables Sociodemographics, p. 479 (Examination) |
| **In subsection 1** | Employment status and occupation |
| **Title** | Prestige scale |
| **Description** | The Standard International Occupational Prestige Scale SIOPS is based on surveys in which people rated job titles in terms of their social prestige. The results were transferred into an internationally comparable, standardised prestige scale for occupations, which is regularly updated (Christoph et al. 2020). The scale ranges from 12 (e.g. shoe shiners) to 78 (physicians). The SIOPS prestige scale was constructed using the iscogen-Commands of Stata (Jann 2019). |

|---|---|
| **Type** | Variable |
| **Superordinate** | Derived variables Sociodemographics, p. 479 (Examination) |
| **In subsection 1** | Employment status and occupation |
| **Title** | Number of employees |
| **Description** | The variable has the values 0, 2 and 11, is based on a_ses_occupation and is used to calculate a_esec. The grouping procedure, including information on the individual classes, is described in the "ESeC User Guide" by Harrison and Rose (2006). The grouping rules were adapted to the special features of the NAKO dataset and distinguish between large (>= 5 employees) and small employers (0 to 4 employees). Calculation of a_nempl is currently only available for the baseline data. |

### 3.15.1.2.23 European Socio-economic Classification

| | |
|---|---|
| **Type** | Variable |
| **Superordinate** | Derived variables Sociodemographics, p. 479 (Examination) |
| **In subsection 1** | Employment status and occupation |
| **Title** | European Socio-economic Classification |
| **Description** | In contrast to ISEI-08 and SIOPS, ESeC (European Socio-economic Classification) is not a continuous status measure, but a categorical, non-hierarchical class scheme (Harrison and Rose 2006). ESeC was developed specifically for the European region. Technically, ESeC classes can be constructed using ISCO-08 occupation codes (3-digit) supplemented by information on occupational status (employer, self-employed or employee), the size of the organisation and whether or not the person is a supervisor. Calculation of a_esec is currently only available for the baseline data. |

### 3.15.1.3 Education

A preliminary derivation according to the International Standard Classification of Education (ISCED) 97 (UNESCO 1997) has been used to depict socio-economic status. The ISCED describes qualitative differences in school and vocational education, summarises school and vocational educational qualifications, is oriented towards educational certificates and ensures the possibility of international comparability (Lampert & Kroll 2009). The derivations are to be regarded as provisional, as the additional plain text data on school and vocational qualifications has not yet been fully analysed.

### 3.15.1.4 Income

The income available to a person or household is used as an important indicator alongside education and occupation to measure social inequality. With the help of need weights, savings made by larger households compared to smaller ones as a result of joint economic activity are taken into account. The need weight is calculated according to the "new OECD scale": The first adult is assigned a weight of 1. For each additional adult living in the household, the value 0.5 is added and for each child under 14 living in the household, the value 0.3 is added. References: Lampert, T., & Kroll, L. E. (2006). Measuring socioeconomic status in socio-epidemiological studies. In Health inequities. Foundations, problems, concepts (pp. 309-334).

## 4.2.1 Derived variables Everyday activities

| | |
|---|---|
| **Type** | Examination (unit) |
| **Superordinate** | Everyday activities, p. 669 (Project) |
| **Name** | Derived variables Everyday activities |
| **Title** | Derived variables everday activities |
| **Description** | Derivation of 6 new variables partly by converting the 8 IADL variables into binary variables (cf. McGauran, Berger and Robra, 2002): 4 variables for the need for help (three from binary variables), 2 for the quantification of response variability. The derived variables were not calculated for participants under 60 years of age who incorrectly completed the questionnaire. Extract from the df100k report on possible effects associated with the optimisation of the touchscreen in Q3 2015: The jump in the relative proportion of missings (respondents who did not answer any of the questions) between Q3 2015 and Q1 2016 by more than 15 percentage points from 9.5% to 25.1% is striking. This general pattern is consistent across all age and gender groups and is most pronounced among the oldest and female respondents. However, the sharp increase is region-specific and can only be observed in certain study centres. Similar to the increase in missings, the need for help rose sharply between Q3/2015 and Q1/2016 (from 39% to 45%), although no consistent pattern is discernible within the individual study centres. The relative frequency of response category 1 (“Not at all difficult“) for each of the 8 items drops sharply by around 10 percentage points between Q3/2015 and Q1/2016. There is no distinct temporal pattern in the response categories 2-4, nor is there a seasonal pattern in the response frequencies. |

## 4.2.2 Everyday activities (U1/2)

| | |
|---|---|
| **Type** | Examination (unit) |
| **Superordinate** | Everyday activities, p. 669 (Project) |
| **Name** | Everyday activities (U1/2) |
| **Title** | - |
| **Description** | Everyday activities, version from 10 February 2014. derived variables are in t_abg_iadl. Extract from the df100k report on effects possibly related to the optimisation of the touchscreen in Q3 2015: The jump in the relative proportion of missings (respondents who did not answer any of the questions) between Q3 2015 and Q1 2016 by more than 15 percentage points from 9.5% to 25.1% is striking. This general pattern is consistent across all age and gender groups and is most pronounced among the oldest and female respondents. However, the sharp increase is region-specific and can only be observed in certain study centres. Similar to the increase in missings, the need for help rose sharply between Q3/2015 and Q1/2016 (from 39% to 45%), although no consistent pattern is discernible within the individual study centres. The relative frequency of response category 1 ("Not at all difficult") for each of the 8 items drops sharply by around 10 percentage points between Q3/2015 and Q1/2016. There is no pronounced temporal pattern in response categories 2-4, nor are there any seasonal patterns in the response frequencies. Baseline data checked in QA report NAKO-368 (Df100k). The data from the second examination are not quality assured. |

| **Name** | Professional recognition |
| **Title** | Derived variables Professional recognition |
| **Description** | Derived variables Professional recognition, derived from the touchscreen module Professional recognition (ERI) baseline in accordance with DF100k report NAKO-434 Professional recognition from 13 July 2020. The ER ratio (ratio of the sum scores of stresses and rewards, multiplied by a correction factor that compensates for the unequal number of items) and the respective tercile of the ER ratio were calculated. As three items of the rewards scale were only collected from October 2015 due to a questionnaire error, the individual scales for stress and rewards were not calculated here. These can be determined from the raw data (ts_eri module) if required. The use of the correction factor leads to plausible values for the ERI ratio without systematic distortion, despite the failures for the three items. The position measures (mean and dispersion) of the subscales for Effort and Reward as well as the derived ERI ratio are comparable to the Socio-Economic Panel and the Swedish SLOSH study, which indicates a high validity of the ERI measurement in the NAKO. The ER ratio increases with age and is always higher for women than for men, which is due to lower professional pay and recognition. For study participants over retirement age, ERI fell as expected, as partial retirement is generally associated with a lower workload. The ER ratio correlates with the self-assessment of general health (d_qol2). |

| | |
|---|---|
| **Type** | Examination (unit) |
| **Superordinate** | Professional recognition, p. 704 (Project) |
| **Name** | Professional recognition (U1) |
| **Title** | - |
| **Description** | Professional recognition, version dated 13 February 2015. The professional recognition module is part of the level 2 touchscreen interview. It consists of two filter questions and 10 items that measure the extent of psychological workload using the Effort-Reward-Imbalance model (ERI model). The extrinsic component of the model consists of the two scales effort and reward. It is postulated that, in addition to the individual scales, their combination in the form of an imbalance in favour of the rewards leads to an increased risk of illness (Siegrist, 1996). In the NAKO, the short version with 10 items was used. On the expenditure side, three questions measure the extent of time pressure and workload (ERI1/ERI2/ERI3). On the reward side, the constructs of recognition (esteem, ERI4/ERI8), job security (ERI6/ERI7) and promotion opportunities (job promotion, ERI5/ERI9/ERI10) are measured using 7 questions, whereby the direction of the scale is reversed for ITEMS ERI5-7 (Siegrist, Li, Montano, 2014). Quality assurance of the baseline data as part of NAKO-434. There are a small number of discrepancies between the answers on employment here (d_eri1) and the answers to the more detailed question on employment in the interview (d_se_b3), which can possibly be explained by the greater scope for interpretation of the touchscreen question. Derived variables are located in abg_eri. |

| | |
|---|---|
| **Type** | Examination (unit) |
| **Superordinate** | Drugs, p. 729 (Project) |
| **Name** | Drugs (U1) |
| **Title** | - |
| **Description** | Drugs, version dated 8 May 2014. 85% of all participants completed the module in the baseline. The first set of questions relates to the previous use of 10 different substance classes. The option "do not wish to answer" was used relatively frequently, possibly due to the increased sensitivity of the participants, as these are mostly illegal drugs. It is also possible that some substances were unknown to the participants. The proportion of "don't want to answer" was even higher in the complex of questions on the lifetime frequency of use of individual substances (only after answering the first question in the affirmative), although the lack of memory of the exact frequency may also have played a role. There were no implausible responses. In the case of "other opiates", which are more frequently used for medical purposes, there was an increase in use with age, in contrast to the other substance classes. In contrast, cannabis, cocaine and synthetic drugs were predominantly used by younger and middle-aged people, most frequently in Berlin-Mitte, Berlin-Süd, Hamburg, Mannheim and Freiburg. Participants in Halle and Neubrandenburg were the least likely to report drug use. Men were about twice as likely as women to have ever used the various substances, with the exception of "other opiates". The overall quality of the data can be described as very good. For reasons of social desirability, a certain degree of underreporting can be assumed. In addition, the sample is not fully representative in terms of social class. Baseline data checked in QS report NAKO-510 (DF200k). |

| **Name** | Weight history (U1/2) |
| **Title** | - |
| **Description** | Weight history, version from 28 September 2018. Baseline data checked in the QA reports NAKO-126 (DF100k) and NAKO-596 (DF200k). Adjustment of secondary examination data carried out analogue to baseline, no QA report. Implementation of the QA was carried out in accordance with the reports, with the exception of the upper limit, from which information on 'implausible value' was recoded. Information was recoded for values over 290 kg. When applying for the variables on weight at the age of 18, 30 and/or 50 years, please always apply for the variable on measured height (a_anthro_groe) so that the BMI can be calculated if necessary. |

| | |
|---|---|
| **Type** | Examination (unit) |
| **Superordinate** | Cardiovascular health, p. 864 (Project) |
| **Name** | Cardiovascular health (U1/2) |
| **Title** | - |
| **Description** | Cardiovascular Health, version dated 27 September 2018; A comparison of the baseline data with that of the calibration study showed that the agreement (reliability) for the individual variables of the module is generally moderate to good. The stability of the data was greater when the interval between the examination dates was shorter (<0.5 years vs. 0.5 to <1.5 years). The baseline data was checked and adjusted according to the QA reports NAKO-104 (DF100k) and NAKO-435 (Df200k). The data from the second examination are not quality assured. |
