## 6.14 SOMNOwatch

| | |
|---|---|
| **Type** | Project |
| **Superordinate** | examinations, p. 1609 (Program) |
| **Title** | SOMNOwatch |
| **Name** | SOMNOwatch |
| **Description** | The SOMNOwatch module is used to record sleep parameters (including sleep disorders) and to record 24-hour long-term ECGs. The Somnowatch is placed on the wrist of the non-dominant arm for a measurement period of 24h. A single-channel ECG is recorded via three electrodes and the participant's respiratory flow is recorded via nasal cannulae during the sleep phase. The data from 3-axis accelerometry, ECG and respiratory flow are stored unfiltered at a high sampling rate (128 or 256 Hz) in a file in European Data Format (EDF). In addition, technical data of the measurement as well as an illumination intensity are recorded. In addition, the participants are asked to document in a sleep log the exact times for going to bed, the targeted falling asleep, waking up, getting up, taking a nap or non-wearing times. In the baseline, a response of 8.3% across all probands and 30.9% for the level 2 probands and a satisfactory quality of the data is achieved. The completeness of the three Somnowatch sub-signals is particularly positive. Within our quality criteria, the accelerometry measurements are 93.8% complete, the 24h long-term ECGs 90.2% complete and the nocturnal respiratory flow measurements 75.7% complete. The analysis of sleep-wake behaviour is performed on the basis of the accelerometry measurements. For scientific use, nine sleep parameters (largely plausible for 84.6% of the measurements) and several error/status variables were determined. An evaluation of the long-term ECGs and determination of the ECG and heart rate variability parameters has not yet taken place. |

## 6.19.2 Dental status data

| | |
|---|---|
| **Type** | Examination (unit) |
| **Superordinate** | Dental status, p. 2171 (Project) |
| **Name** | Dental status data |
| **Title** | - |
| **Description** | Oral health: Dental examination data. Due to implementation errors, only the right side was predominantly analysed until May 2016; from May 2016 onwards, the right or left side was analysed approximately equally. The values 8 and 9 mm in the pocket depths are overrepresented due to software errors (see description of the variable zahn_swversion). These errors could only be corrected if the data was clear. By comparing the tooth and denture findings from the basic study data with the calibration data (approx. 2,000 cases), 592 "newly grown" teeth were identified, particularly in the premolar and molar region. The following scenarios appear plausible: bridge -> crown; "newly grown tooth" due to gap closure (tooth missing without prosthetic restoration -> tooth present without/with restoration); implant -> tooth present. In a few cases, a breakthrough of the number 8 could be suspected as the cause of the "newly grown" tooth. When processing the data as part of a data utilisation request, these uncertainties in the dental and prosthetic findings must be taken into account and, if necessary, the data from the calibration or second examinations must also be requested in order to be able to evaluate the data with regard to its plausibility and correctness. Implausible data can only be corrected in the course of a third examination at the earliest. |

| **Name** | tooth number |
| **Title** | Recording of the number of teeth and dentures |
| **Description** | Recording the number of teeth and dentures (Level 1). Data quality limitations: In 15.1% of the participants for whom data were available in both the baseline and the calibration examination, a larger number of teeth was documented in the calibration examination than in the baseline examination. In 0.1% of cases, an implausible combination of values of denture number=2 and number of teeth>25 was documented. In 9 cases, a number of teeth >0 was documented in the upper and lower jaw despite the indication of a complete denture. These implausibilities cannot be corrected using only the data from the baseline examination; a plausibility check may be possible after completion of the second examination. |

|---|---|
| **Description** | This dataset contains gray matter volumes for each region of the whole-brain parcellation of the Julich-Brain Cytoarchitectonic Atlas, which is complemented by Gapmaps to achieve full cortical coverage, where regions have not been mapped cytoarchiteconically so far, based on T1-weighted 3D GRE sequence of the brain (MP-RAGE), sagittal orientation, matrix size of 256x256x300, computed using Software Computational Anatomy Toolbox (CAT12v8-Beta.r1853; https://neuro-jena.github.io/cat/). The JulichBrain Cytoarchitectonic Maps can be found at https://atlases.ebrains.eu/viewer/#/ and have been described in Amunts K, Mohlberg H, Bludau S, Zilles K.
