Type	Examination (unit)
Superordinate	Dental status, p. 2518 (Project)
Name	Dental status data
Title	-
Description	Oral health: Dental examination data. Due to implementation errors, only the right side was predominantly analysed until May 2016; from May 2016 onwards, the right or left side was analysed approximately equally. The values 8 and 9 mm in the pocket depths are overrepresented due to software errors (see description of the variable zahn_swversion). These errors could only be corrected if the data was clear. By comparing the tooth and denture findings from the basic study data with the calibration data (approx. 2,000 cases), 592 "newly grown" teeth were identified, particularly in the premolar and molar region. The following scenarios appear plausible: bridge -> crown; "newly grown tooth" due to gap closure (tooth missing without prosthetic restoration -> tooth present without/with restoration); implant -> tooth present. In a few cases, a breakthrough of the number 8 could be suspected as the cause of the "newly grown" tooth. When processing the data as part of a data utilisation request, these uncertainties in the dental and prosthetic findings must be taken into account and, if necessary, the data from the calibration or second examinations must also be requested in order to be able to evaluate the data with regard to its plausibility and correctness. Implausible data can only be corrected in the course of a third examination at the earliest.

Type	Examination (unit)
Superordinate	Dental status, p. 2518 (Project)
Name	tooth number
Title	Recording of the number of teeth and dentures
Description	Recording the number of teeth and dentures (Level 1). Data quality limitations: In 15.1% of the participants for whom data were available in both the baseline and the calibration examination, a larger number of teeth was documented in the calibration examination than in the baseline examination. In 0.1% of cases, an implausible combination of values of denture number=2 and number of teeth>25 was documented. In 9 cases, a number of teeth >0 was documented in the upper and lower jaw despite the indication of a complete denture. These implausibilities cannot be corrected using only the data from the baseline examination; a plausibility check may be possible after completion of the second examination.

Quantification of the fat fraction using the 3D liver segmentation mask of the deep learning model. The entire model was implemented in NORA (www.nora-imaging.com), an open source platform for medical imaging.

Type	Examination (unit)
Superordinate	Derived neuro MRI data, p. 3425 (Project)
Name	Gray matter volume for JulichBrain atlas
Title	Gray matter volume for JulichBrain atlas processed w CAT12.8

Description	This dataset contains gray matter volumes for each region of the whole-brain parcellation of the Julich-Brain Cytoarchitectonic Atlas, which is complemented by Gapmaps to achieve full cortical coverage, where regions have not been mapped cytoarchiteconically so far, based on T1-weighted 3D GRE sequence of the brain (MP-RAGE), sagittal orientation, matrix size of 256x256x300, computed using Software Computational Anatomy Toolbox (CAT12v8-Beta.r1853; https://neuro-jena.github.io/cat/). The JulichBrain Cytoarchitectonic Maps can be found at https://atlases.ebrains.eu/viewer/#/ and have been described in Amunts K, Mohlberg H, Bludau S, Zilles K. Julich-Brain: A 3D probabilistic atlas of the human brains cytoarchitecture. Science. 2020 Aug 21;369(6506):988-992. doi: 10.1126/science.abb4588.
